

TODO: Replace Browser Alerts with In-App Notifications

Files to Edit

- ☒ src/app/pages/order-tracking/order-tracking.component.ts
- ☒ src/app/pages/checkout/checkout.component.ts
- ☒ src/app/pages/admin/admin-settings/admin-settings.component.ts
- ☐ src/app/pages/vendeur/add-product/add-product.component.ts
- ☐ src/app/shared/components/client/produits/produit.component.ts
- ☐ src/app/pages/admin/add-product/add-product.component.ts
- ☐ src/app/core/services/whatsapp.service.ts

Steps

1. For each file, inject NotificationService if not already injected.
2. Replace alert() calls with appropriate notification service methods.
3. Use NotificationType.ERROR for error messages, NotificationType.SUCCESS for success messages, etc.
4. Test that notifications appear in the app instead of browser alerts.
